

**CATALOGUE 11.22**

## FLOORING GRADES AND FINISHING

### Grading ●▲■

The grades of the timber species are selected in accordance with UNI EN 13489.

#### Top-class grade ●▲

This is the most refined grade of the wood which features beautiful shades of colour and very few, if any, sound knots.  
A top-class grade surface will have a more uniformed look.

#### Natural grade ■

This grade of wood sports knots of bigger size and a wider colour variation between the planks.  
Any holes, cracks, or imperfections, which are natural features of the wood, are wisely filled using wood fillers.

### Finishing

#### UV oil

A water-repellent product, obtained by applying flavoured UV oil.  
Ideal for customising the wood and for a vintage look.

#### Hydro-Lak

A product made of next-gen water-based varnishes, able to enhance the naturalness of wood and guarantee a low environment impact.

## PROCESSING TECHNIQUES AND LAYING WOOD PATTERNS

### Processing techniques

#### Smooth

Open grain, sanded and smooth parquet featuring simple lines.

#### Light brushed

Gently brushed, it gives a velvet touch to the floor, enhancing the natural look of the wood.

#### Brushed

A carved surface with a rough effect gives a more lived-in style to the environment.

#### Bevelled

Each side of the plank is slightly bevelled, giving character and uniqueness to the room.

#### Planed

Hand-planing creates irregularities and undulations, giving the wood surface an aged look.

#### Sawn-edge

Perpendicular carving highlights the irregularity of the surface, giving the wood floor a modern and sophisticated look.

#### Hand-scraped

Hand-scraping adds character to the surface, making each plank unique and enhancing the naturalness of the wood.

#### Original patina

Original antique wooden floorboards, aged by time and from use. The surface is not processed, it is only cleaned to preserve and restore its original condition. The hydro-lak finish gives the wood floor a natural raw effect.

THRESHOLD

Cod. ACSEFSU

**IMPORTANT**

- 1) Store the product into a dry place with no temperature fluctuations. Some days before the installation the planks should be left in the room where they are about to be laid and given time to adjust.
- 2) Open the packaging carefully to avoid the damage of the planks. We recommend the disposal of packaging in accordance with current regulations.
- 3) Pay attention to sharp edges. Do not hit the planks to preserve the extreme precision of the joint system.
- 4) When laying the planks, we recommend the use of rubber-coated tools.
- 5) For a suitable installation, the screed must be dry, compact, smooth and without cracks and it may contain only 2.5% moisture at the very most. If these prerequisites are not met, do not proceed with laying the floor until proper adjustment treatments are carried out.
- 6) "Alberani Parketti" products should be preferably laid by glueing. Use only single or two-component polyurethane adhesives for glueing the planks.
- 7) Once the floor has been laid, humidity in the area has to be around 55% and the temperature kept at around 20-21°, to keep the structural features of the parquet.
- 8) Because of our strict quality control checks, our products are guaranteed if boxed: in the event of small defects, please report them promptly before the installation.
